SauceDemo Manual QA Testing

Project Overview

This project documents manual quality assurance testing performed on the SauceDemo (Swag Labs) e-commerce website as part of a QA assignment.

Website: https://www.saucedemo.com/

Testing Type: Manual QA Testing
Role: Pure QA
Tester: Kunal Appa

Testing Scope

The testing covers the following areas:

- Login and authentication
- Product catalog and product details
- Product sorting functionality
- Shopping cart functionality
- Checkout workflow and order confirmation
- Keyboard accessibility and UI interactions
- Navigation controls and form input validation

Test Environment

- **Operating System:** Windows
- **Browser:** Microsoft Edge
- **Application:** SauceDemo web application

Test Data

The assignment provides the following test accounts:

Username	Purpose
`standard_user`	Standard application functionality
`locked_out_user`	Login error handling
`problem_user`	Testing application behavior with known issues
`performance_glitch_user`	Observing performance-related behavior

Password for the provided accounts: `secret_sauce`

Project Files

File / Folder	Description
`Test-Plan.md`	Test scope, testing types, environment, test data, and risk assessment
`Test-Case-Results.md`	Test scenarios, expected results, actual observations, and status
`bug-reports/`	Detailed defect reports, reproduction steps, and severity/priority assessments

Testing Approach

Testing was performed manually by interacting with the website through the browser.

The approach included:

1. Exploring the application's main workflows.
2. Checking UI behavior and keyboard interactions.
3. Comparing expected behavior with observed results.
4. Documenting potential defects with reproduction steps.
5. Recording test results and identifying findings that require further verification.

Only findings supported by actual observations should be treated as confirmed defects. Findings requiring additional testing are marked accordingly.

Bug Reports

The defect reports document observations involving areas such as:

- Keyboard focus and navigation
- Product images and product details
- Product sorting
- Checkout form input
- Order confirmation page interactions

Each report includes the relevant environment, preconditions, reproduction steps, expected result, actual result, reproducibility, and verification status.

Video Demonstrations

Video 1 — Test Plan Overview

Link: [Add your first Loom video URL here]

This video explains the test plan, testing scope, test execution approach, and defect documentation process.

Video 2 — Manual Bug Discovery

Link: [Add your second Loom video URL here]

This video demonstrates the findings reproduced during manual testing and explains their expected behavior, actual behavior, and potential user impact.

Limitations

- Testing was performed in the documented environment.
- Cross-browser behavior should only be considered verified if testing was actually performed in additional browsers.
- Suspected defects require further verification before being classified as confirmed.
- Automated testing is excluded because this submission follows the Pure QA track.

Conclusion

This project documents the manual testing process for the SauceDemo e-commerce application, including test planning, execution observations, and defect reporting. The objective is to assess application behavior, identify potential usability and functional issues, and communicate findings clearly.
